Meta-analysis of the prevalence of depression in adults with diabetes

- Increased risk (OR= 2.9) of depression in type 2 DM
- Estimated prevalence of major depression= 11.4%;
Prevalence of elevated depressive symptoms= 26%
- Depression likely to impair functioning, quality of life, adherence to medical treatment, glycemic control and increase complications risk

Anderson et al., *Diabetes Care*, 2001

Prevalence of inability to do physical tasks and basic activities of daily living among U.S. women age 60+ with and without diabetes (NHANES III)

**Efficacious
Interventions
Exist**

Type 2 Diabetes Mellitus

By implementing what we know, we can:

- 1. Halve the incidence of diabetes**
- 2. Halve the complications of diabetes**

Reduction in Incidence of Diabetes

Diabetes Incidence Rates by Age

$p = 0.007$ ILS by age
 $p = 0.067$ metformin by age

Diabetes Incidence Rates by Ethnicity

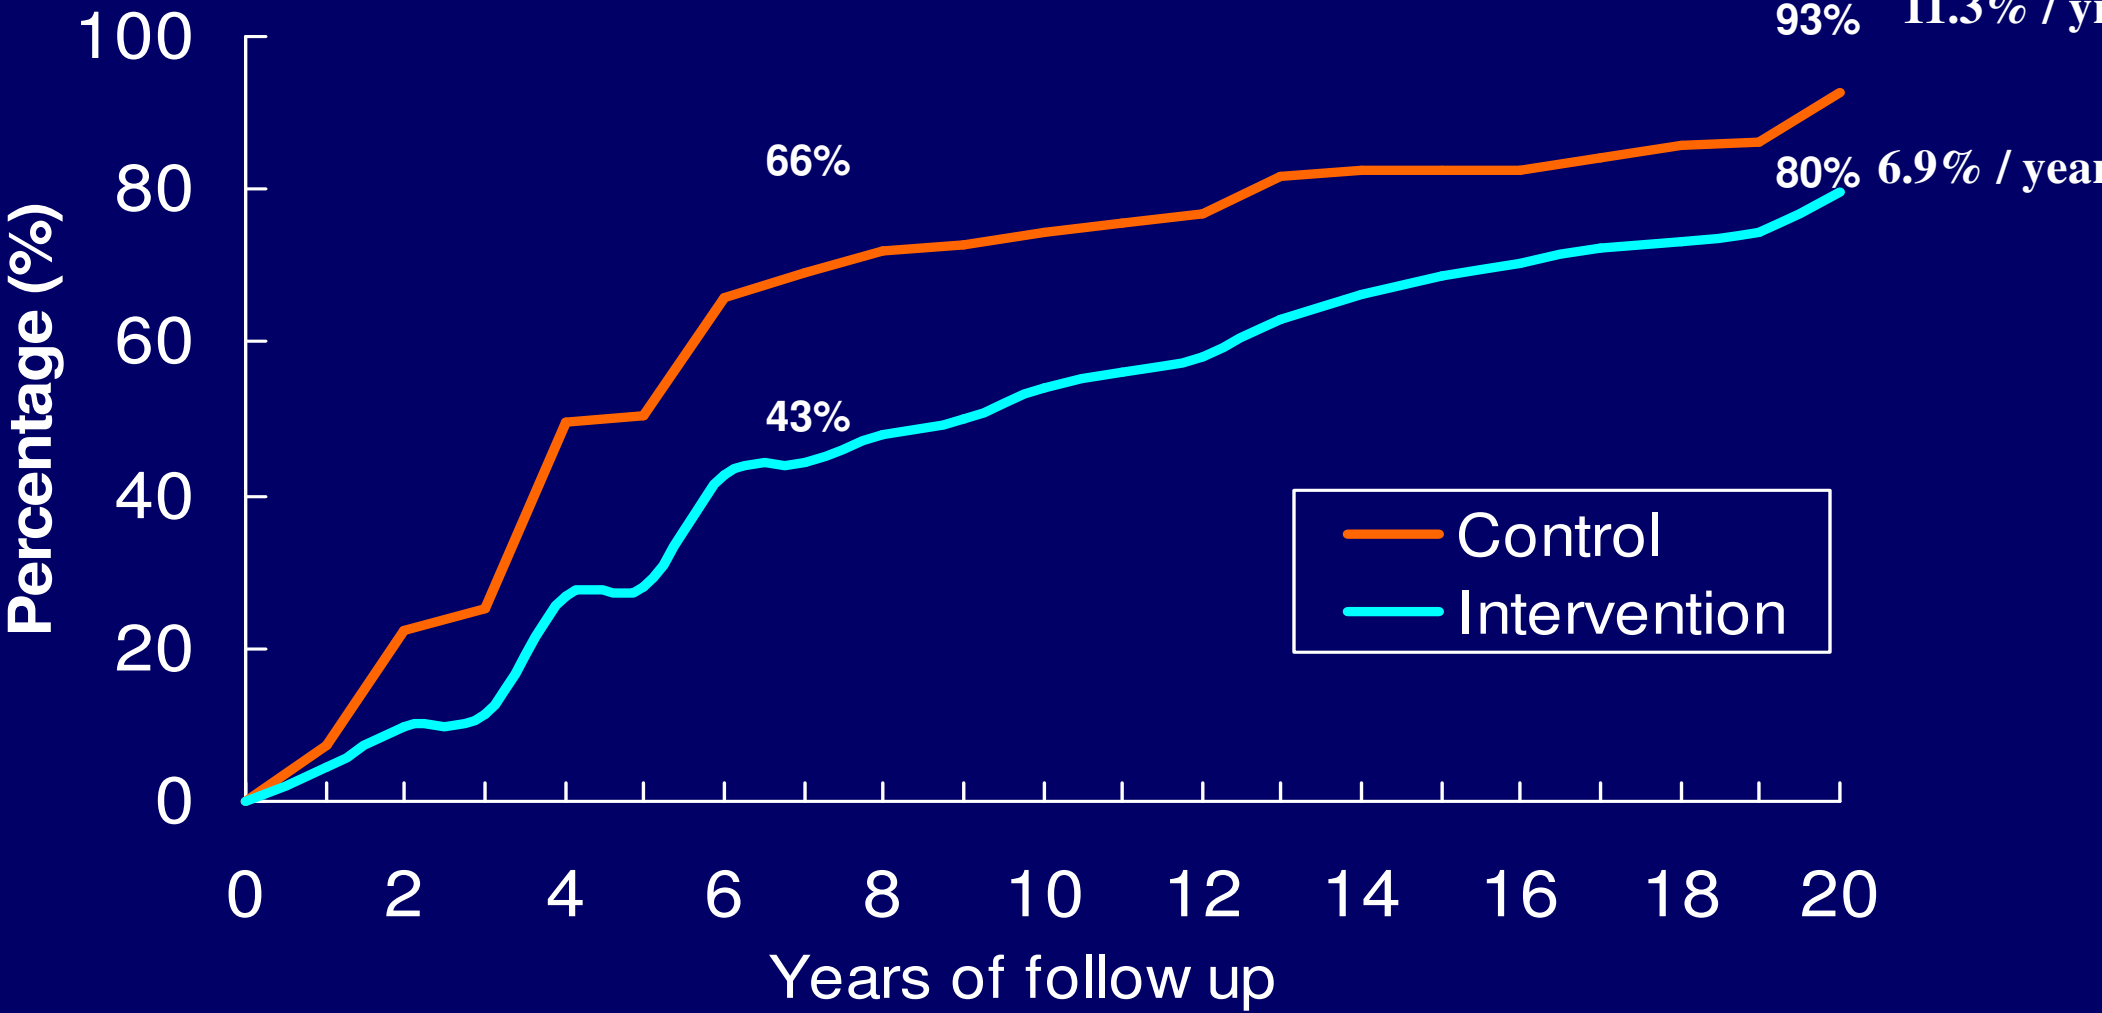

TCF7L2 Genotype and Diabetes Incidence in the DPP

Florez et al. for the DPP Research Group: *New Engl J Med* 2006

Cumulative Incidence of Diabetes in the China Da Qing Diabetes Prevention Follow-up Study

HRR 0.57 (95% CI, 0.41 – 0.81)

*Age and cluster variable clinic adjusted

Efficacious treatments to prevent complications

Strategy	Benefit
Glycemic control	30% ↓ microvas disease per 1%
Blood pressure control	24% ↓ microvas disease per 10mm
Lipid control	55% ↓ CHD events; 43% ↓ death
Aspirin use	28% ↓ in M.I., 18% ↓ CVD
Eye exams	60 – 70% ↓ in severe vision loss
Foot exams	50 - 60% ↓ in serious foot disease
Flu shots	32% ↓ hosp; 64f% ↓ resp. cond + death
Diabetes education	Knowledge, behaviors, glycemic control

Effect of Comprehensive Intensive Policy on Outcomes

- Steno Diabetes Center (Denmark)

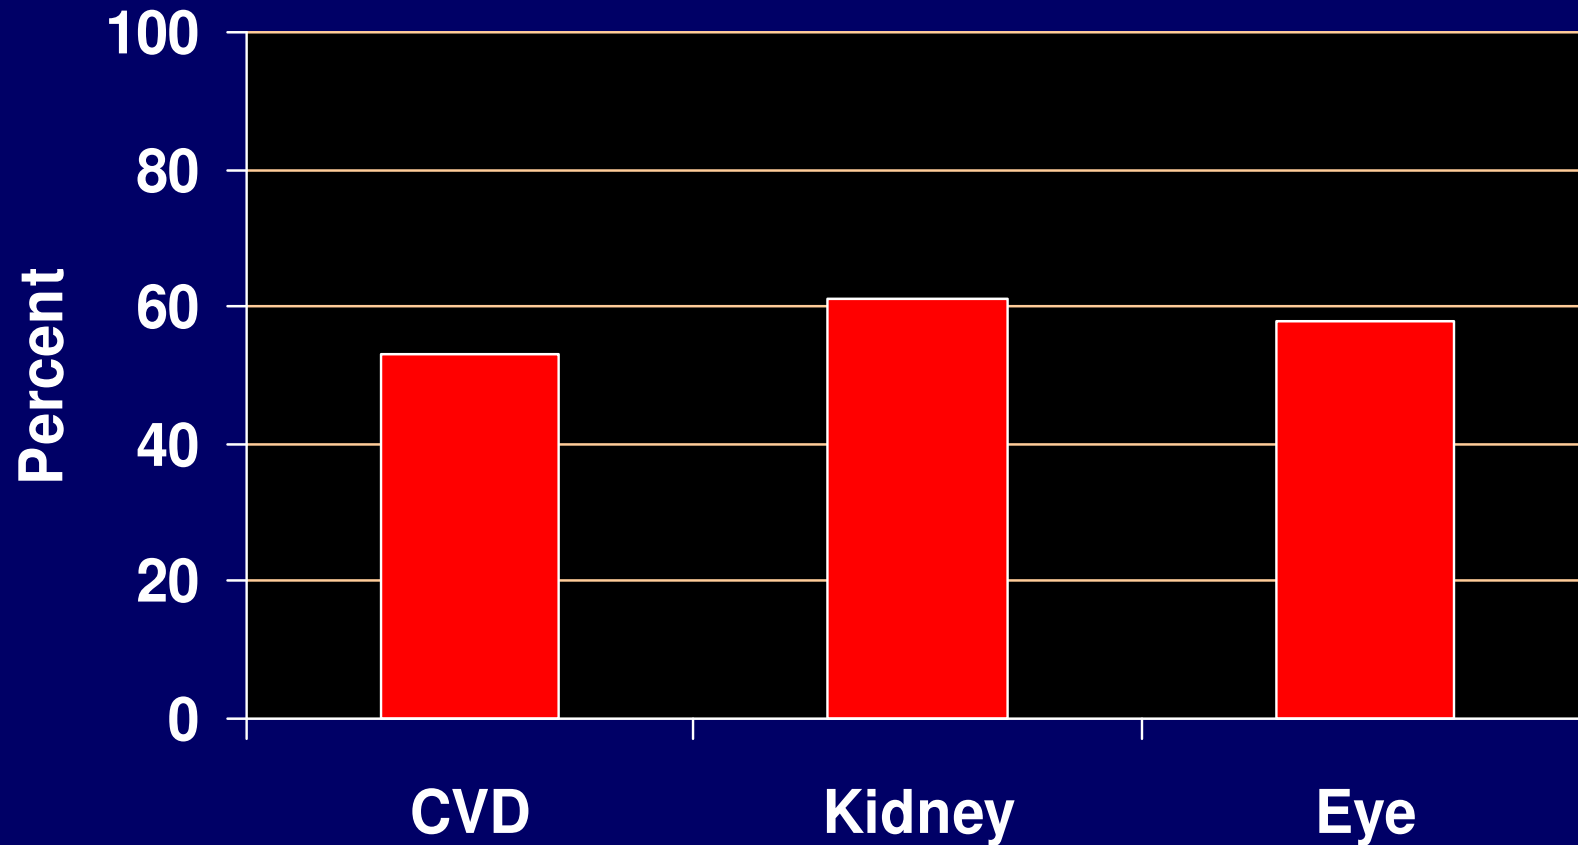

- Trial of patients with DM and microalbuminuria

 - 80 patients: intensive BP, A1c, lipids, ACE, aspirin

 - 80 patients: standard care

- Followed 8 yrs

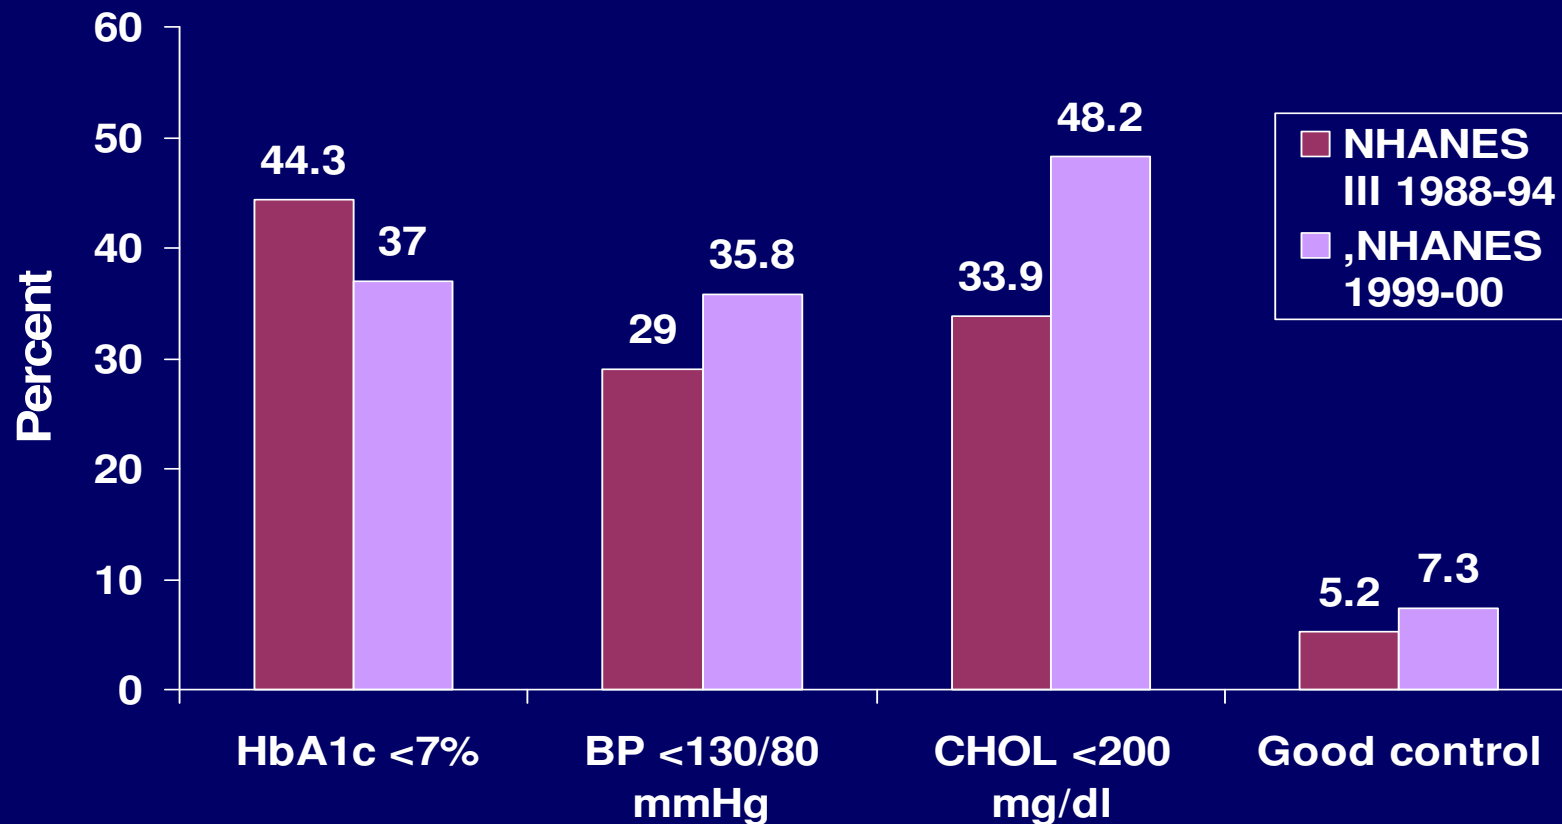

Percent reduction in clinical outcomes: Intensive policy group

Gaede P et al NEJM 2003

**Implementation
of
Interventions
Suboptimal**

Basic RESEARCH

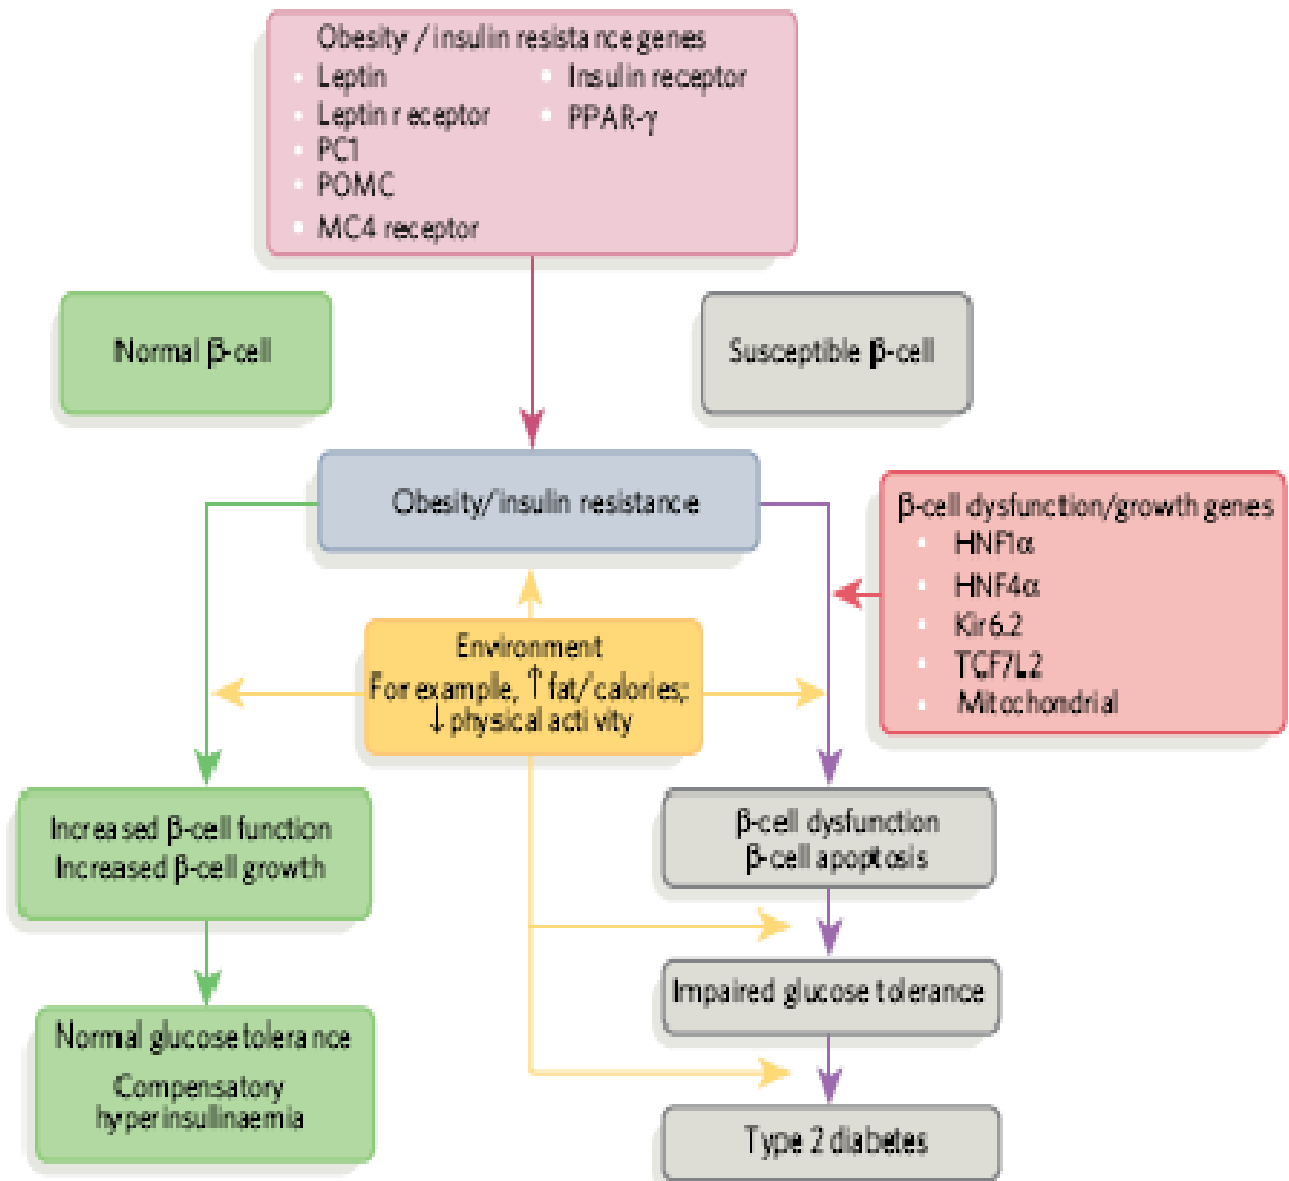

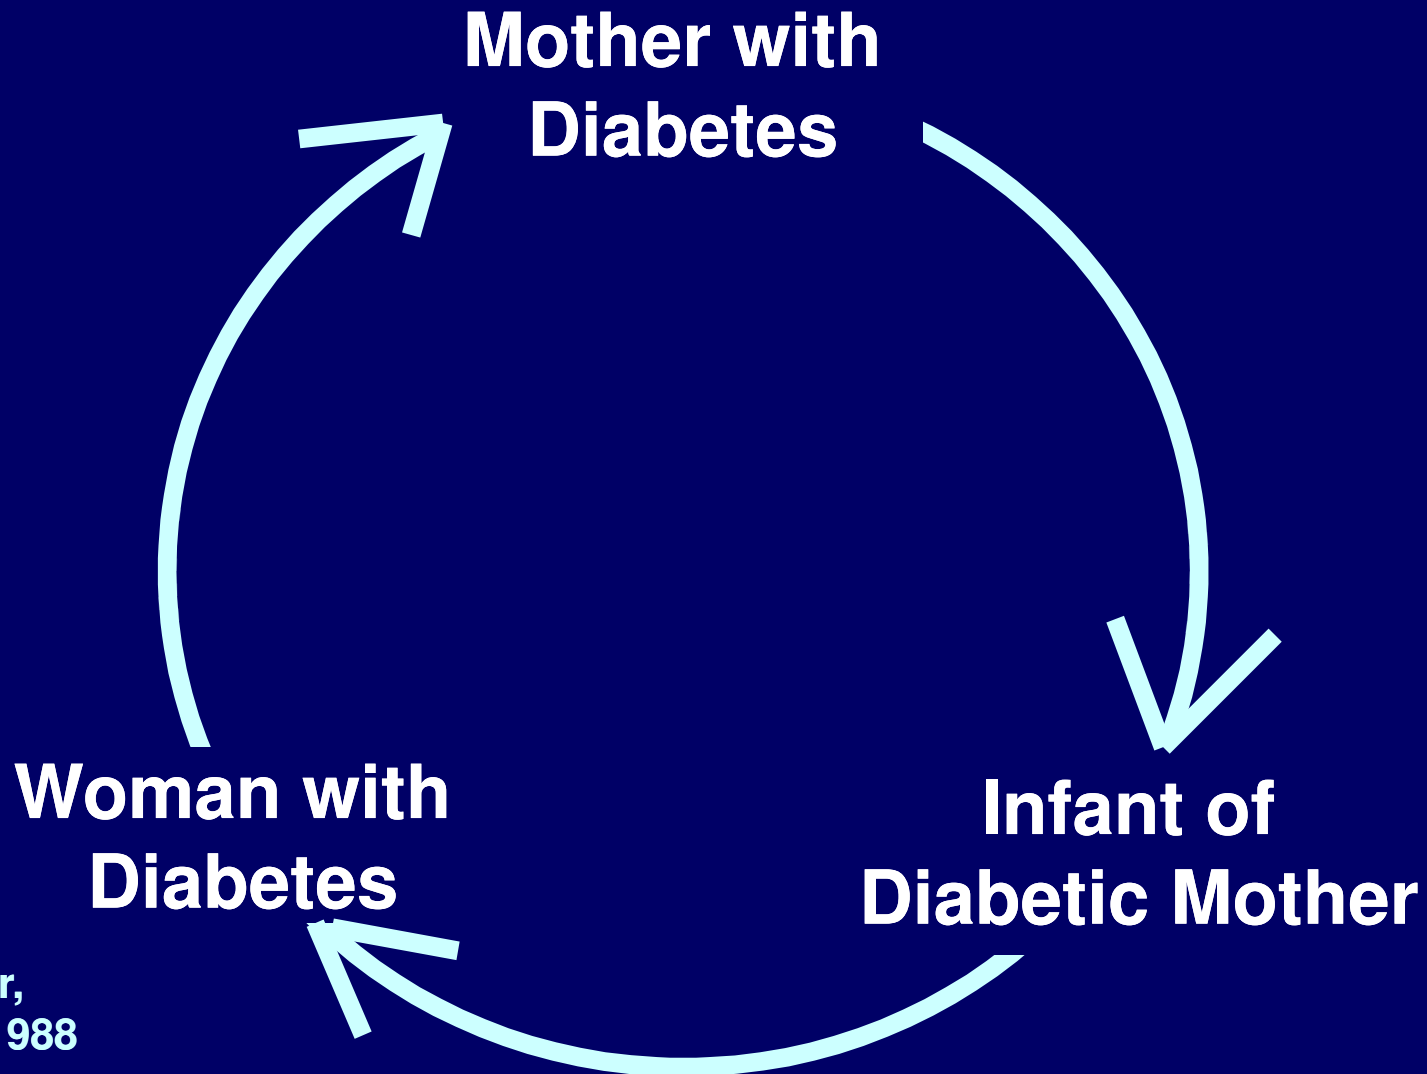

Figure 3 | Interaction of genes and the environment in individuals who maintain normal glucose tolerance and those who develop type 2 diabetes. Genes responsible for obesity and insulin resistance interact with environmental factors (increased fat/caloric intake and decreased physical activity), resulting in the development of obesity and insulin resistance. These increase secretory demand on β -cells. If the β -cells are normal, their function and mass increase in response to this increased secretory demand, leading to compensatory hyperinsulin aemia and the maintenance of normal glucose tolerance. By contrast, susceptible β -cells have a genetically determined risk, and the combination of increased secretory demand and detrimental environment result in β -cell dysfunction and decreased β -cell mass, resulting in progression to impaired glucose tolerance, followed, ultimately, by the development of type 2 diabetes. HNF, hepatocyte nuclear factor.

Genes Potentially Associated with Type 2 Diabetes

TCF7L2	GCK	IPF-1	NeuroD	RBP4
PPAR γ	GCG	IRS-1	NPY	RETN
KCNJ11	GIP	IRS-2	NPY2R	SIM1
AQP10	GLP1R	ISL-1	NPY4R	SHIP2
AGRP	GLP2R	KCNJ10	PAX4	CAPN10
CART	GNAT3	KLF2	PGC-1	GYS
CB1R	GRL	KLF7	POMC	THR
DIO2	HNF-1 α	KLF15	HLA	UBL5
DPP4	HNF-1 β	KLF11	PPARGC1 β	UCP-2
ENPP1	HNF-4 α	LEP	PBEF	UCP-3
FABP2	IAPP	LEPR	PCSK1	11BHSD
FASN	IDE	MC3R	PTPN1	ADRB2
FOXC2	INSIG2	MC4R	PPY	ADRB3

Translation Research

Opportunities to improve care delivery

- Target organ damage
- CVD events
- Mortality

Knowledge

Need

Concluding thoughts.....

- Burden of diabetes among older adults is large and growing
- Special challenges for older adults: polypharmacy, depression, falls, disability, cognitive decline
- Research has provided knowledge to partially prevent diabetes and its complications
- But the agenda is still incomplete
 - Need more research to understand the causes of diabetes, so that it can be prevented
 - Need more research to translate knowledge into practice
